

Codeless Integration | Flexible and Easy-to-Use | Cost-Effective | Unparalleled Performance

A leading integration solution provider, **KingswaySoft**, has launched a new product offering real-time data integration for businesses that require instantaneous data across all applications. **Integration Gateway** allows developers to setup webhook listeners to receive messages from modern cloud applications, and publish them to one or more message queues or file system. From there developers can trigger further integrations by pushing the data to its final destination, such as using a SSIS task, or anything that can receive messages from a queue and further process them.

How Does Integration Gateway Work?

Apps publish changes through webhooks. **Integration Gateway** works as a hub between webhooks and message queues or file systems and publishes received webhook messages to a message queue or file system in real-time. Real-time integration is finally done by having a listener service that monitors the message queue or file system and pushes the messages to their final destinations. The listener service can be a SSIS package that uses a combination of Premium Queue Message task and other components offered by KingswaySoft or any other equivalent solutions.

Click [here](#) to see how you can, for instance, integrate **HubSpot** with **Microsoft Dynamics 365 CE/CRM** in real-time.

Why Use Integration Gateway ?

Perform Real-Time Data Integration

Publish immediately to message queues and file systems when Integration Gateway receives a notification from your online services.

Connect to Any Online Service

Connect Integration Gateway with any modern cloud applications via webhooks.

Always Listening

With webhooks, Integration Gateway continually monitors online applications for any change in data.

Set and Forget

As a Windows Service, Integration Gateway will run automatically at boot and will continue to do so regardless if a user is logged in.

No More Schedules

Skip the schedule and batch processes and have Integration Gateway run when the data changes.

Keep Your Data Local

Retain control of your data with Integration Gateway running on your local system.
